

ANYMODAL EDIT

VERSION 5.4.2573

IMPROVEMENTS

Added author's middle name property in the CDA

AuthorMiddle is now a property of ICdsEditorDocument.

RESOLVED ISSUES

Updated EIK Edit Button for Fields

Resolved issue with the Edit button for fields; previous bug caused the fields to change to regular text. This bug has been resolved.

Client applications can now complete section titles via TAB when ShowAutoCompleteHints=true

Resolved issue that prevented client applications from completing section titles via TAB when they did not have ShowAutoCompleteHints=true.

Resolved Problem Attaching/Detaching AME COM Event Listeners

Due to a bug in AME's IConnectionPoint implementation COM event listeners were not removed properly: AtlUnadvise would not remove the listener that the client intended but a different (sort of random) one. Was a bug since AME 5.2.2490.

Bug Fix for Number Pad Period/Delete Key

Resolved issue that prevented the Period/Delete key on the number pad from working correctly.

Resolved Issue when hosting AME in a Java (Swing) app that caused the enter key to be ignored

Enter key didn't do anything in Java apps hosting AME thru EZJCOM in certain document locations: previously reproducible by loading EIK's blank.xml into EIK's TestSwing sample.

Inserting text next to form field no longer extends field highlighting

Resolved issue with form fields extending the highlighting to include words or punctuation directly before or after the form field. This no longer occurs.

Resolved AME Crashing in IE

Since AME 2.51, IE/DHTML applications could crash the IE tab process if AME was hosted in an IE HTML dialog at dialog closing time. This was due to an AME workerthread not shutting down in time during IE's unconventional ActiveX DLL unload process in this scenario.

Popup Message Boxes No Longer Display When On-The-Fly Spell Check Encounters A Problem

AME no longer displays popup message boxes when on-the-fly spell check encounters a problem; this has been disabled to prevent issues within the application.

Resolved Issue that caused the "Boolean Editable" setting to not apply to Section Titles

Setting the Editing property to false will prevent the Section Title popup from changing Section Titles when an item is selected. To prevent the Section Title popup from appearing, set the SectionTitlePopupEnabled property to false.

Added new option for CTRL+Right Arrow to move the cursor to the end of the current word, instead of the beginning of the next word

SetProperty("gotoEndOfWordOnCtrlRight", "true") to move the cursor to the end of the next word with CTRL+Right Arrow. By default, AME emulates MS Word and other editors and moves the cursor to the beginning of the next word.

Improved handling of typing suggestions dropdown in AME

Title dropdown will only appear on typing a character, space, backspace, delete, or CTRL-space. Any other ctrl/alt combination will not cause the dropdown to appear.

Select <word> command no longer selects preceding punctuation

The "select <phrase>" command previously include punctuation preceding the word or phrase selected. This has been corrected.
